## Q1. Git/GitHub

**No handwritten homework reports are accepted for this course.** We work with Git and GitHub. Efficient and abundant use of Git, e.g., frequent and well-documented commits, is an important criterion for grading your homework.

- 1. Apply for the <u>Student Developer Pack</u> at GitHub using your UCLA email. You'll get GitHub Pro account for free (unlimited public and private repositories).
- 2. Create a **private** repository biostat-203b-2025-winter and add Hua-Zhou and TA team (Tomoki-Okuno for Lec 1; parsajamshidian and BowenZhang2001 for Lec 82) as your collaborators with write permission.

- 3. Top directories of the repository should be hw1, hw2,... Maintain two branches main and develop. The develop branch will be your main playground, the place where you develop solution (code) to homework problems and write up report. The main branch will be your presentation area. Submit your homework files (Quarto file qmd, html file converted by Quarto, all code and extra data sets to reproduce results) in the main branch.
- 4. After each homework due date, course reader and instructor will check out your main branch for grading. Tag each of your homework submissions with tag names hw1, hw2,... Tagging time will be used as your submission time. That means if you tag your hw1 submission after deadline, penalty points will be deducted for late submission.
- 5. After this course, you can make this repository public and use it to demonstrate your skill sets on job market.

Solution Done.

# Q2. Data ethics training

This exercise (and later in this course) uses the MIMIC-IV data v3.1 , a freely accessible critical care database developed by the MIT Lab for Computational Physiology. Follow the instructions at <a href="https://mimic.mit.edu/docs/gettingstarted/">https://mimic.mit.edu/docs/gettingstarted/</a> to (1) complete the CITI Data or Specimens Only Research course and (2) obtain the PhysioNet credential for using the MIMIC-IV data. Display the verification links to your completion report and completion certificate here. You must complete Q2 before working on the remaining questions. (Hint: The CITI training takes a few hours and the PhysioNet credentialing takes a couple days; do not leave it to the last minute.)

**Solution** Here is the Completion Report and Completion Certificate of my CITI training.

## **Q3. Linux Shell Commands**

1. Make the MIMIC-IV v3.1 data available at location ~/mimic. The output of the 1s -1 ~/mimic command should be similar to the below (from my laptop).

```
# content of mimic folder
ls -l ~/mimic/
```

### total 24

```
-rwxrwxrwx 1 zxhyu zxhyu 15199 Jan 21 23:40 CHANGELOG.txt
-rwxrwxrwx 1 zxhyu zxhyu 2518 Jan 21 23:40 LICENSE.txt
-rwxrwxrwx 1 zxhyu zxhyu 2884 Jan 21 23:40 SHA256SUMS.txt
drwxrwxrwx 1 zxhyu zxhyu 4096 Jan 24 01:20 hosp
drwxrwxrwx 1 zxhyu zxhyu 4096 Jan 21 23:42 icu
```

Refer to the documentation <a href="https://physionet.org/content/mimiciv/3.1/">https://physionet.org/content/mimiciv/3.1/</a> for details of data files. Do **not** put these data files into Git; they are big. Do **not** copy them into your directory. Do **not** decompress the gz data files. These

create unnecessary big files and are not big-data-friendly practices. Read from the data folder ~/mimic directly in following exercises.

Use Bash commands to answer following questions.

**Solution:** I have downloaded the MIMIC IV v3.1 data and it's available under ~/mimic folder as requested.

2. Display the contents in the folders hosp and icu using Bash command 1s -1. Why are these data files distributed as .csv.gz files instead of .csv (comma separated values) files? Read the page https://mimic.mit.edu/docs/iv/ to understand what's in each folder.

**Solution:** Here is the content of hosp folder

```
ls -l ~/mimic/hosp/
```

```
total 6153124
-rwxrwxrwx 1 :
```

```

-rwxrwxrwx 1 zxhyu zxhyu 49307639 Jan 21 23:42 outputevents.csv.gz

-rwxrwxrwx 1 zxhyu zxhyu 24096834 Jan 21 23:42 procedureevents.csv.gz
```

The .csv.gz files are compressed versions of .csv files. These data were distributed as .csv.gz file because the files are too large to be stored or downloaded. To ensure there are enough spaces to store and the users could downlad the dataset in faster speed, the data files are distributed as .csv.gz files instead of the .csv

3. Briefly describe what Bash commands zcat, zless, zmore, and zgrep do.

**Solution:**For zcat, it reads and outputs the contents of a .gz file to the standard output; for zless, it opens a .gz file in a scrollable viewer and allows you to navigate the file's content without extracting the file; for zmore, it displays the content of a .gz file one screen at a time; for zgrep, it looks for specific patterns or keywords within a .gz file.

4. (Looping in Bash) What's the output of the following bash script?

```
for datafile in ~/mimic/hosp/{a,l,pa}*.gz
do
    ls -l $datafile
done
```

```
-rwxrwxrwx 1 zxhyu zxhyu 19928140 Jan 21 23:40 /home/zxhyu/mimic/hosp/admissions.csv.gz
-rwxrwxrwx 1 zxhyu zxhyu 2592909134 Jan 21 23:41 /home/zxhyu/mimic/hosp/labevents.csv.gz
-rwxrwxrwx 1 zxhyu zxhyu 2835586 Jan 21 23:41 /home/zxhyu/mimic/hosp/patients.csv.gz
```

**Solution:** The above is the output of the bash script.

Display the number of lines in each data file using a similar loop. (Hint: combine linux commands zcat < and wc -1.)

```
for datafile in ~/mimic/hosp/{a,l,pa}*.gz
do
    echo "File: $datafile"
    zcat "$datafile" | wc -l
done
```

```
File: /home/zxhyu/mimic/hosp/admissions.csv.gz
546029
File: /home/zxhyu/mimic/hosp/labevents.csv.gz
158374765
File: /home/zxhyu/mimic/hosp/patients.csv.gz
364628
```

**Solution:** The number of lines in admissions is 546029, the number of lines in labevents is 158374765, and the number of lines in patients is 364628.

5. Display the first few lines of admissions.csv.gz. How many rows are in this data file, excluding the header line? Each hadm\_id identifies a hospitalization. How many hospitalizations are in this data file? How many

unique patients (identified by subject\_id) are in this data file? Do they match the number of patients listed in the patients.csv.gz file? (Hint: combine Linux commands zcat <, head/tail, awk, sort, uniq, wc, and so on.)

**Solution:** Here is the first few lines of admissions.csv.gz

```
zcat < ~/mimic/hosp/admissions.csv.gz | head</pre>
```

subject\_id,hadm\_id,admittime,dischtime,deathtime,admission\_type,admit\_provider\_id,admission\_locat
ion,discharge\_location,insurance,language,marital\_status,race,edregtime,edouttime,hospital\_expire
\_flag

The number of rows in this data file, excluding the header line, is

```
zcat < ~/mimic/hosp/admissions.csv.gz | tail -n +2 | wc -l</pre>
```

#### 546028

The number of hospitalizations in this data file is

```
zcat < ~/mimic/hosp/admissions.csv.gz |
tail -n +2 |
awk -F, '{print $2}' |
sort |
uniq |
wc -l</pre>
```

### 546028

which is the same as the number of rows in the file.

The number of unique patients in this data file is

```
zcat < ~/mimic/hosp/admissions.csv.gz |
tail -n +2 |
awk -F, '{print $1}' |
sort |
uniq |
wc -l</pre>
```

### 223452

which is less than the number of patients listed in the patients.csv.gz file

```
zcat < ~/mimic/hosp/patients.csv.gz |
tail -n +2 |
awk -F, '{print $1}' |
sort |
uniq |
wc -l</pre>
```

#### 364627

6. What are the possible values taken by each of the variable admission\_type, admission\_location, insurance, and ethnicity? Also report the count for each unique value of these variables in decreasing order. (Hint: combine Linux commands zcat, head/tail, awk, uniq -c, wc, sort, and so on; skip the header line.)

### **Solution:**

```
zcat ~/mimic/hosp/admissions.csv.gz | head -1
```

subject\_id,hadm\_id,admittime,dischtime,deathtime,admission\_type,admit\_provider\_id,admission\_locat
ion,discharge\_location,insurance,language,marital\_status,race,edregtime,edouttime,hospital\_expire
\_flag

admission\_type takes 6, admission\_location takes 8, insurance takes 10, and ethnicity takes 13.

Regarding the count for each unique value of these variables For admission\_type:

```
zcat ~/mimic/hosp/admissions.csv.gz |
tail -n +2 |
awk -F, '{print $6}' |
sort |
uniq |
wc -l
```

9

For admission\_location:

```
zcat ~/mimic/hosp/admissions.csv.gz |
tail -n +2 |
awk -F, '{print $8}' |
sort |
uniq |
wc -1
```

12

For insurance:

```
zcat ~/mimic/hosp/admissions.csv.gz |
tail -n +2 |
awk -F, '{print $10}' |
sort |
uniq |
wc -l
```

6

For ethnicity:

```
zcat ~/mimic/hosp/admissions.csv.gz |
tail -n +2 |
awk -F, '{print $13}' |
sort |
uniq |
wc -l
```

33

In decreasing order, the count of unique values are 33, 12, 9, 6.

7. The icustays.csv.gz file contains all the ICU stays during the study period. How many ICU stays, identified by stay\_id, are in this data file? How many unique patients, identified by subject\_id, are in this data file?

Solution:

```
zcat ~/mimic/icu/icustays.csv.gz | head
```

```
subject_id,hadm_id,stay_id,first_careunit,last_careunit,intime,outtime,los

Count ICU stays:

```
zcat ~/mimic/icu/icustays.csv.gz |
tail -n +2 |
awk -F',' '{print $3}' |
wc -1
```

#### 94458

Count unique patients:

```
zcat ~/mimic/icu/icustays.csv.gz |
tail -n +2 |
awk -F',' '{print $1}' |
sort |
uniq |
wc -1
```

### 65366

Therefore, there are 94458 ICU stays and 65366 unique patients.

8. To compress, or not to compress. That's the question. Let's focus on the big data file labevents.csv.gz. Compare compressed gz file size to the uncompressed file size. Compare the run times of zcat < ~/mimic/labevents.csv.gz | wc -1 versus wc -1 labevents.csv. Discuss the trade off between storage and speed for big data files. (Hint: gzip -dk < FILENAME.gz > ./FILENAME.Remember to delete the large labevents.csv file after the exercise.)

**Solution:** First, we unzip the labevent file:

```
gzip -dk ~/mimic/hosp/labevents.csv.gz
```

The size of the compressed and uncompressed file respectively:

```
ls -lh ~/mimic/hosp/labevents.csv.gz
ls -lh ~/mimic/hosp/labevents.csv
```

```
-rwxrwxrwx 1 zxhyu zxhyu 2.5G Jan 21 23:41 /home/zxhyu/mimic/hosp/labevents.csv.gz
```

-rwxrwxrwx 1 zxhyu zxhyu 18G Jan 21 23:41 /home/zxhyu/mimic/hosp/labevents.csv

The run time of the compressed and uncompressed files respectively:

```
time zcat < ~/mimic/hosp/labevents.csv.gz | wc -l
time wc -l ~/mimic/hosp/labevents.csv</pre>
```

#### 158374765

```
real 2m20.165s
user 1m32.272s
sys 0m18.963s
158374765 /home/zxhyu/mimic/hosp/labevents.csv
real 6m7.641s
user 0m0.894s
sys 0m5.999s
```

Regarding trade offs between storage and speed for big data files, it is obvious from my result that the compressed file takes up significantly less storage space than the uncompressed file, and the compressed file has shorter run times than the uncompressed file. While expectively the uncompressed file would take shorter time to run than the compressed file since the system could read the data directly without spending time to unzip the file, but the reason for the longer processing time for the uncompressed file in my case could be due to the large size of the file.

Delete the large decompressed labevent file:

```
rm ~/mimic/hosp/labevents.csv
```

# Q4. Who's popular in Price and Prejudice

1. You and your friend just have finished reading *Pride and Prejudice* by Jane Austen. Among the four main characters in the book, Elizabeth, Jane, Lydia, and Darcy, your friend thinks that Darcy was the most mentioned. You, however, are certain it was Elizabeth. Obtain the full text of the novel from <a href="http://www.gutenberg.org/cache/epub/42671/pg42671.txt">http://www.gutenberg.org/cache/epub/42671/pg42671.txt</a> and save to your local folder.

```
wget -nc http://www.gutenberg.org/cache/epub/42671/pg42671.txt
```

#### Solution: Done.

Explain what wget -nc does. Do **not** put this text file pg42671.txt in Git. Complete the following loop to tabulate the number of times each of the four characters is mentioned using Linux commands.

```
for char in Elizabeth Jane Lydia Darcy
do
  echo $char:
```

```
grep -o "\b$char\b" pg42671.txt | wc -l
done
```

Elizabeth:

634

Jane:

293

Lydia:

170

Darcy:

416

**Solution:** wget -nc prevents the command from overwriting an existing file with the same name in the current directory; Elizabeth was mentioned 634 times, Jane was mentioned 293 times, Lydia was mentioned 170 times, and Darcy was mentioned 416 times.

2. What's the difference between the following two commands?

```
echo 'hello, world' > test1.txt
```

and

```
echo 'hello, world' >> test2.txt
```

**Solution:** Although both commands create the file if the file doesn't exist, the first command has the ">" operater which overwrites the contents in text1.txt and replace them with "hello, world" if it already exists while the second command has the ">>" operator which doesn't overwrite the file even if it already exists but instead preserves the existing content and adds "the new text"hello, world" at the end.

3. Using your favorite text editor (e.g., vi), type the following and save the file as middle.sh:

```
#!/bin/sh
# Select lines from the middle of a file.
# Usage: bash middle.sh filename end_line num_lines
head -n "$2" "$1" | tail -n "$3"
```

Using chmod to make the file executable by the owner, and run

```
chmod +x middle.sh
./middle.sh pg42671.txt 20 5
```

Release date: May 9, 2013 [eBook #42671]

Language: English

Explain the output. Explain the meaning of "\$1", "\$2", and "\$3" in this shell script. Why do we need the first line of the shell script?

**Solution:** The above is my output. I have these outputs because the head command takes the first 20 lines from the file pg42671.txt and the tail command takes the last 5 lines from the output of the head command. This results in the 5 lines from line 16 to line 20 of the original file and my outputs are part of lines 16 to 20 in pg42671.txt.

"\$1" stands for the first argument passed to the script (pg42671.txt in this case) and this is the name of the file to be processed. "\$2" stands for the second argument (20), which specifies the number of lines to select using the head command. "\$3" stands for the third argument (5), which specifies the number of lines to select from the output of the head command using tail.

We need the first line of the shell script because it specifies the interpreter to be used to execute the script and preventing the system to try to interpret the script with a different shell.

## Q5. More fun with Linux

Try following commands in Bash and interpret the results: cal, cal 2025, cal 9 1752 (anything unusual?), date, hostname, arch, uname -a, uptime, who am i, who, w, id, last | head, echo {con,pre}{sent,fer} {s,ed}, time sleep 5, history | tail.

### **Solution:**

```
cal
```

For cal, it displays the calendar for the current month;

```
cal 2025
```

```
2025
                           February

							30														

For cal 2025, it displays the calendar for the entire year 2025;

```
cal 9 1752
```

For cal 9 1752, it displays the calendar for September 1752. However, the calender is missing dates from September 3 to 13;

date

Fri Jan 24 02:43:10 PST 2025

For date, it displays the current date and time;

hostname

Zhiyuan

For hostname, it displays the name of my computer or system (Zhiyuan);

```
arch
```

x86\_64

For arch, it shows my system's architecture(x86\_64);

```
uname -a
```

Linux Zhiyuan 5.15.167.4-microsoft-standard-WSL2 #1 SMP Tue Nov 5 00:21:55 UTC 2024  $\times$ 86\_64  $\times$ 86\_64 GNU/Linux

For uname -a, it displays detailed information about my laptop's system, including the kernel name, version, and system architecture;

```
uptime
```

```
02:43:10 up 8:16, 1 user, load average: 1.07, 1.01, 0.68
```

For uptime, it displays the current time, how long the system has been running, the number of users(for me there is just one), and the system load average;

```
whoami
```

zxhyu

For who am i, it displays information about my current session on who logged in the system;

```
who
```

```
zxhyu pts/1 2025-01-23 18:04
```

For who, it displays information about the user logged in, terminal, and login time;

```
W
```

```
02:43:10 up 8:16, 1 user, load average: 1.07, 1.01, 0.68

USER TTY FROM LOGIN@ IDLE JCPU PCPU WHAT

zxhyu pts/1 - 18:04 8:38m 0.00s ? -bash
```

For w, its display is more like a combination of the display by running uptime, who am i, and who and some additional information;

```
id
```

```
 \begin{array}{lll} uid=&1000(zxhyu) & gid=&1000(zxhyu) \\ groups=&1000(zxhyu), & 4(adm), & 20(dialout), & 24(cdrom), & 25(floppy), & 27(sudo), & 29(audio), & 30(dip), & 44(video), & 44(plugdev), & 100(users), & 107(netdev) \\ \end{array}
```

For id, it displays my ID (UID), group ID (GID), and group memberships for the current user;

```
last | head
```

```
reboot
        system boot 5.15.167.4-micro Thu Jan 23 18:04
                                                         still running
        system boot 5.15.167.4-micro Thu Jan 23 15:05
reboot
                                                         still running
         system boot 5.15.167.4-micro Thu Jan 23 13:27
reboot
                                                         still running
        system boot 5.15.167.4-micro Thu Jan 23 11:58
reboot
                                                         still running
reboot
         system boot 5.15.167.4-micro Wed Jan 22 18:14
                                                         still running
        system boot 5.15.167.4-micro Wed Jan 22 17:55
reboot
                                                         still running
         system boot 5.15.167.4-micro Tue Jan 21 23:41
reboot
                                                         still running
        system boot 5.15.167.4-micro Tue Jan 21 14:56
reboot
                                                         still running
reboot
         system boot 5.15.167.4-micro Tue Jan 21 11:35
                                                         still running
reboot
        system boot 5.15.167.4-micro Mon Jan 20 18:42
                                                         still running
```

For last | head, it displays first 10 most recent login history of users due to head;

```
echo {con,pre}{sent,fer}{s,ed}
```

consents consented confers confered presents presented prefers prefered

For echo {con,pre}{sent,fer}{s,ed}, it shows all possible combinations of the text inside the curly braces ({}), for me they are consents consented confers confered presents presented prefers prefered;

```
time sleep 5
```

```
real 0m7.272s
user 0m0.001s
sys 0m0.000s
```

For time sleep 5, it measures the time it takes to execute the sleep 5 command, which pauses the terminal for 5 seconds. For me it shows real(0m5.004s), user(0m0.002s), and sys time(0m0,000s);

```
history | tail
```

For history | tail, it displays the most recent 10 commands I executed from my bash command history.

# Q6. Book

1. Git clone the repository <a href="https://github.com/christophergandrud/Rep-Res-Book">https://github.com/christophergandrud/Rep-Res-Book</a> for the book *Reproducible Research with R and RStudio* to your local machine. Do **not** put this repository within your homework repository biostat-203b-2025-winter.

2. Open the project by clicking rep-res-3rd-edition.Rproj and compile the book by clicking Build Book in the Build panel of RStudio. (Hint: I was able to build git\_book and epub\_book directly. For pdf\_book, I needed to add a line \usepackage{hyperref} to the file Rep-Res-Book/rep-res-3rd-edition/latex/preabmle.tex.)

The point of this exercise is (1) to obtain the book for free and (2) to see an example how a complicated project such as a book can be organized in a reproducible way. Use sudo apt install PKGNAME to install required Ubuntu packages and tlmgr install PKGNAME to install missing TexLive packages.

For grading purpose, include a screenshot of Section 4.1.5 of the book here. **Solution:** Here is the screenshot of Section 4.1.5:

## 4.1.5 Spaces in directory and file names

It is good practice to avoid putting spaces in your file and directory names. For example, I called the example project parent directory in Figure 4.1 "example-project" rather than "Example Project". Spaces in file and directory names can sometimes create problems for computer programs trying to read the file path. The program may believe that the space indicates that the path name has ended. To make multiword names easily readable without using spaces, adopt a consistent naming convention.

One approach is to use a convention that contrasts with the R object naming convention you are using. A contrasting convention helps make it clear if something is an R object or a file name. For example, if we adopt the underscore method for R object names used in Chapter 3 (e.g. health\_data) we could use hyphens ( - ) to separate words in file names. For example: example-source.R . This is sometimes called kebab-case.
